

# ABSTRACT:

- The online hiring has brought a huge change in the recruitment process. It became easy for many companies to advertise their jobs .It has also become easy for people to know about the jobs available in the market. The recruitment has become easier and faster.
- The competition in the market has increased and unemployed are finding it difficult to find out about the new job openings. The companies are also facing the crisis of finding the suitable candidates for the job. An online job portal can be a one stop solution for the companies as well as the the applicants.

# OBJECTIVE:

- The objective of this project is to build a job portal using html and Mysql. The job portal should allow the companies to post a job and see the applications of the candidates applied for the job. The portal should also display the list of available jobs for the candidates to apply.

# INTRODUCTION:

- The portal first requires the companies to register. Then only the registered companies can view the application page where they can post the job and in the same page can view the the other jobs that are posted. From that page we can navigate to another page where we can see the details of the candidates applied for the job.
- The job portal page consists of the list of jobs that have been posted by the companies. The users can apply for the job by mentioning their details in the same page. These details are stored in the application page for the companies to see. The tools used in this project are html, css, bootstrap, PHP, MySQL and Xampp.

# METHODOLOGY:

- The job portal has the following modules:

1.Registration

2.Login

3.Index

4.Jobs

5.Career

## **REGISTRATION:**

This page allows the companies to register. If already registered this page provides the link to the login page.

## **LOGIN:**

- This page allows the registered users to login to the index page.If not registered then the page provides the link for login page.

## **INDEX:**

- This page allows the companies to post the jobs.They are required to mention the details like job title, CTC ,job requirements etc. From this page we can navigate to the Jobs page.

## **JOBS:**

- This page consists the information about the candidates registered for the job and their details.

## **CAREER:**

- This page shows the list of jobs applied by the companies in index page.This page also allows the candidates to apply for the job by mentioning their details which are reflected in the jobs page.
- The index and jobs pages can only be accessed by the registered companies .The career page can be accessed by any user.

- The tables created for this portal are:

1.users

2.jobs

3.candidates

### **Users:**

- The users table stores information about the registered companies and this table is used to login.

### **Jobs:**

- This table stores information about the jobs posted and this table is used to post jobs available in the careers page.

### **Candidates:**

- This table stores information about the candidates applying the job and this data is reflected in the jobs page for the companies.
- The config.php file consists of the code required to manage sql queries.
